

A photograph of a person walking on a snowy mountain slope. The person is small and dark, walking away from the camera on a path of snow. The sky is overcast and grey. The snow is white and textured with footprints.

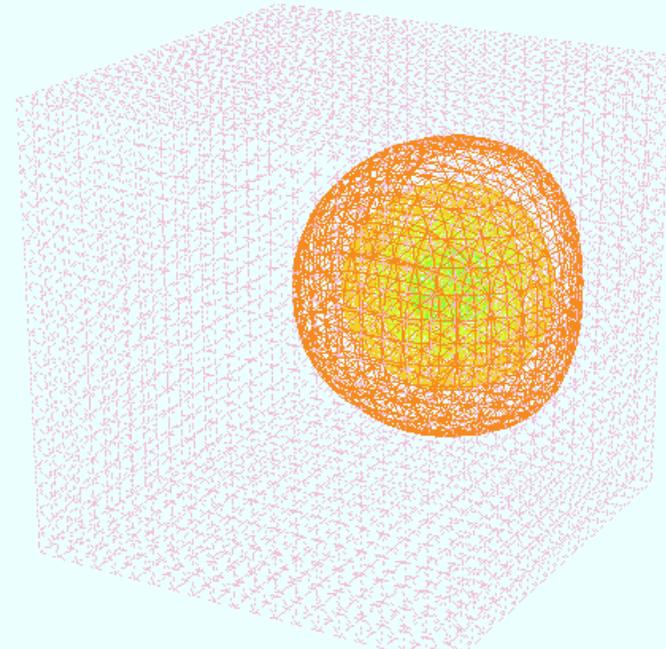

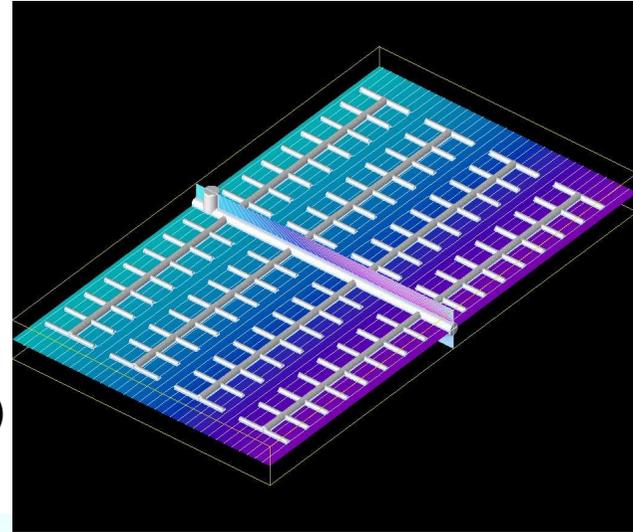

Introduction to freefem++

Olivier Pironneau

LJLL-UPMC

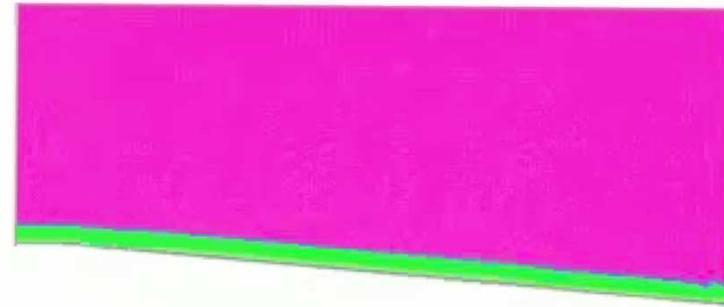

History

- 1985: MacFEM – PCFEM
- 1990: syntax analyzer (+ D. Bernardi) **freefem**
- 1995: **freefem+** (+ Hecht)
- 2000: **freefem++** (Hecht alone)
- 2000: **freefem3D** (DelPino, Havé , Pironneau)
- 2003: an integrated environment + web (Lerouzic)
- 2005: a new documentation (+ Ohtsuka)
- 2009: **freefem++3D**
- A web site www.freefem.org
- do not mix **freefem++3xx** and ff3D:
 - Fictitious domain & mesh gen by marching cube
 - Parallel iterative solver with multigrid

Leading ideas

- Follow the math => variational formulation
- Algorithms are the user's responsibility
- Blocks: An elliptic + upwinding operator
- Use Finite Element Methods
- Automatic mesh generation with adaptivity
- Follow the research front (if it is FEM it can be done with freefem++)

$$\partial_t u + a \cdot \nabla u - \nu \Delta u = f, \quad u|_{\partial\Omega} = 0$$

$$\frac{u^{m+1}(x) - u^m(x - a^m(x)\delta t)}{\delta t} - \nu \Delta u(x) = f^m(x)$$

$$\int_{\Omega} (uw + \delta t \nu \nabla u \nabla w) = \int_{\Omega} (u^m \circ X w + \delta t f w) \quad \forall w \in H_0^1(\Omega)$$

```
solve A(u,w) = int2d(th) (u*w+ nu*dt*grad(u)*grad(w))  
- int2d(th) (convect(v, [a1,a2], -dt)+ f*w*dt )  
+ on(bdy, u=0);
```

Collaborations

- **Dev. team** (ff2a3) : F. Hecht (Kernel) , A. le Hyaric (Graphic), J. Morice (PostDoc 2years, 3d Mesh, Solver ..), G. A. Atenekeg (PostDoc 1 an, Solver //), S. Auliac (Phd 3 years, automatic Diff.), O. Pironneau (Tests and Documentation), ...
- **Testing sites** : LJLL : 4, IRMAR : 3, CMAP : 3, INRIA : 3, Seville : 3 Know users more than 300 in the world , in more than 20 country
- **Industry** : EADS, Dassault, CEA, Andras, IFREMER, PME...
- **Teaching** : Ecole Polytechnique, Mines, Central, Pont et Chaussées...
- **Universities** : Orsay, UMPC, Rennes, Metz, Grenoble, Seville, Jyvaskyla Finlande, Kénitra Maroc, Annaba, Setif Algérie, ENIT Tunisie, Belgique, USA, Japan, Chine , Chili.
- **FreeFem++ days** at IHP (Paris) : 80 participants, 12 nationality,

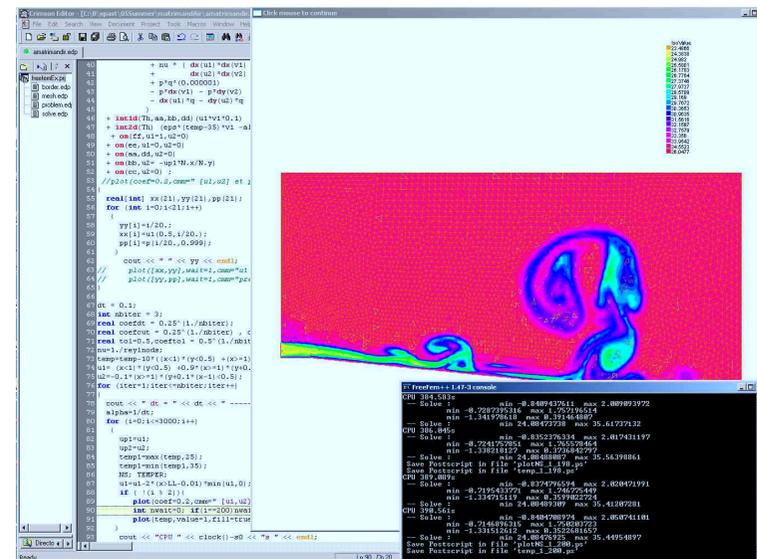

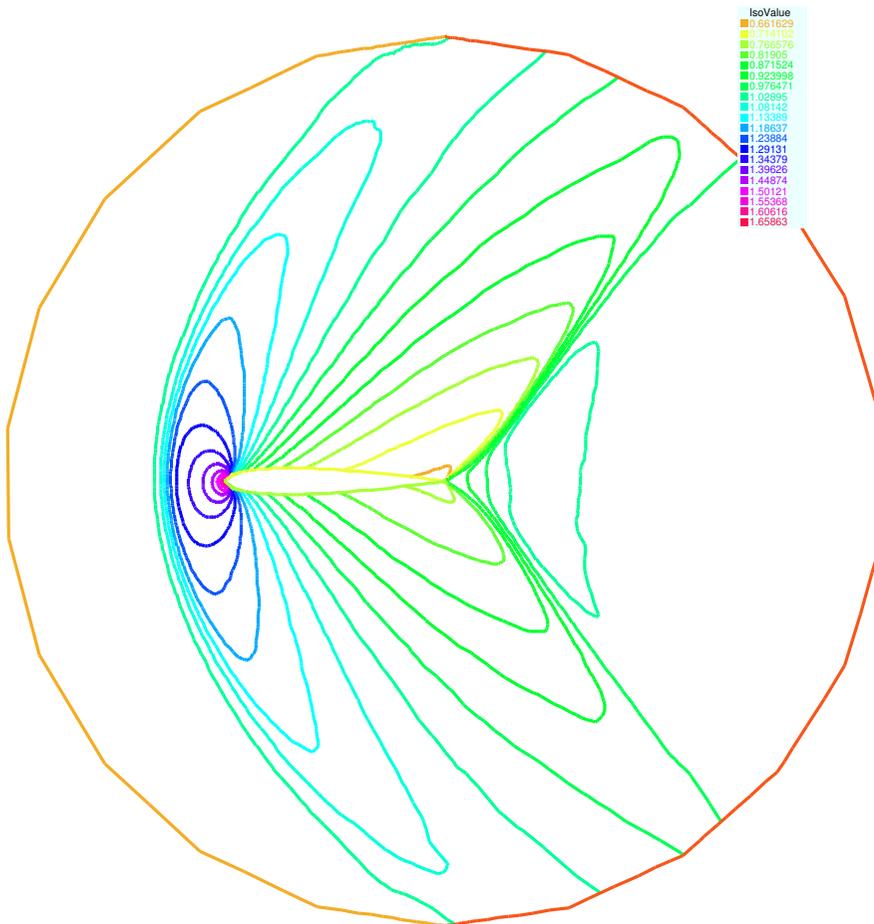

freefem++ documentation

Freefem++

Third Edition, Version 3.4-2

<http://www.freefem.org/ff++>

F. Hecht

A Dirichlet Problem

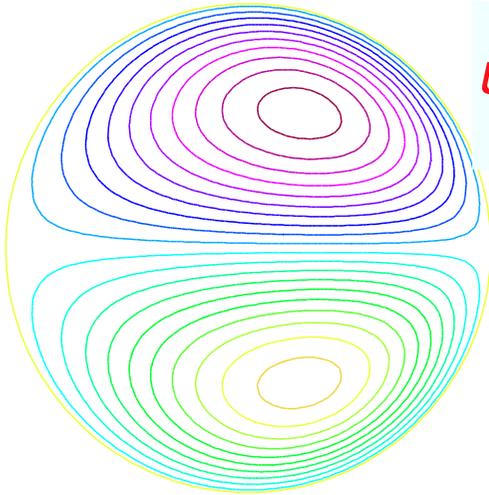

$$-\Delta u = f, \quad u|_{\partial\Omega} = 0$$

Variational formulation

$$u \in H_0^1(\Omega) ? : \int_{\Omega} \nabla u \nabla w = \int_{\Omega} f w \quad \forall w \in H_0^1(\Omega)$$

Approximation

$$\int_{\Omega} \nabla u_h \nabla w_h = \int_{\Omega} f w_h \quad \forall w_h \in V_0$$

```
border a(t=0, 2*pi) { x = cos(t); y = sin(t); }  
mesh th = buildmesh(a(70));  
fespace Vh(th,P2);  
func f= exp(x) * sin(y) ;  
Vh u,w;  
solve A(u,w)=int2d(th)(dx(u)*dx(w)+ dy(u)*dy(w))-int2d(th)(f*w)  
+ on(a,u=0);  
plot(u, ps= "membrane.eps");
```

Integrated Development Environment

- Edit/compile/debug = freefem++-CS (by A. Leyaric)
- Your favorite editor + terminal window
- Smultron (Mac) Crimpson(Windows) + scripts

The screenshot displays the FreeFem++ integrated development environment (IDE) running on a Mac. The interface is divided into several windows:

- Code Editor:** Shows the source code for a problem, including boundary definitions, mesh generation, and the solution process. The code is as follows:

```
1 rborder a(t=0,1.0){x=t; y=0; label=1;} // comment
2 rborder b(t=0,0.5)(x=1; y=t; label=2;);
3 rborder c(t=0,0.5)(x=1-t; y=0.5; label=3;);
4 rborder d(t=0.5,1)(x=0.5; y=t; label=4;);
5 rborder e(t=0.5,1)(x=1-t; y=1; label=5;);
6 rborder f(t=0.0,1)(x=0; y=1-t; label=6;);
7 mesh Th = buildmesh (a(6) + b(4) + c(4) + d(4) + e(4) + f(6));
8 savemesh(Th,"th.mesh");
9 fespace Vh(Th,P2);
10 Vh u,v;
11 real error=0.01;
12 problem Problem1(u,v,solver=CG,eps=1.0e-6) =
13   int2d(Th,qforder=2)( u*v*1.0e-10+ dx(u)*dx(v) + dy(u)*dy(v)
14   + int2d(Th,qforder=2)( (x-y)*v);
15 int i;
16 for (i=0;i< 4;i++)
17 {
18   Problem1;
19   cout << u[] .min << " " << u[] .max << endl;
20   plot(u,wait=1);
21   Th=adaptmesh(Th,u,err=error);
22   plot(Th,wait=1);
23   u=u;
24   error = error/2;
25 };
26
```
- Terminal:** Shows the execution of the FreeFem++ program. The output includes the number of degrees of freedom (DF) and the results of the solve operation for three different mesh refinements:

```
Nb of DF = 57
-- Solve :
-0.116868 0.113293
-- mesh: Nb of Triangles = 242, Nb of Vertices 144
Nb of edges on Mortars = 0
Nb of edges on Boundary = 44, neb = 44
Nb of Nodes = 144
Nb of DF = 144
-- Solve :
min -0.120132 max 0.116518
-0.120132 0.116518
-- mesh: Nb of Triangles = 547, Nb of Vertices 309
Nb of edges on Mortars = 0
Nb of edges on Boundary = 69, neb = 69
Nb of Nodes = 309
Nb of DF = 309
-- Solve :
min -0.120908 max 0.117362
-0.120908 0.117362
-- mesh: Nb of Triangles = 1099, Nb of Vertices 601
Nb of edges on Mortars = 0
Nb of edges on Boundary = 101, neb = 101
Nb of Nodes = 601
Nb of DF = 601
-- Solve :
min -0.121209 max 0.117744
-0.121209 0.117744
```
- Mesh Visualization:** A central window displays a circular domain with a mesh of triangles. The mesh is colored with a gradient from blue to red, representing the solution values. The mesh is refined near the boundaries.
- File Manager:** Shows the file structure of the project, including the source code files and the generated mesh files.

ubuntu-64

The screenshot displays a Linux desktop environment with the following components:

- Terminal Window:** Shows the execution of the FreeFem++ solver. It displays three solve iterations with the following parameters:
 - Solve 1: min -0.00243917, max 0.00201228. Solution # 129, Dimension 2, Size of solution 1988, Approximation P1, Mesh vertices 1988, Mesh triangles 3814, Solution dimension 1.
 - Solve 2: min -0.00221702, max 0.00146628. Solution # 130, Dimension 2, Size of solution 1988, Approximation P1, Mesh vertices 1988, Mesh triangles 3814, Solution dimension 1.
 - Solve 3: min -0.00221702, max 0.00146628. Solution # 131, Dimension 2, Size of solution 1988, Approximation P1, Mesh vertices 1988, Mesh triangles 3814, Solution dimension 1.
- FreeFem++ Application:** A window titled "FreeFem++" showing a 3D surface plot of a wave equation solution. The plot is titled "Une equation des ondes - l=6.45" and "Saved scene 130 / 130". The plot shows a complex, wavy surface with a color scale ranging from -0.009474 (red) to 0.009474 (purple). The axes are labeled x, y, and z. The z-axis ranges from -0.006 to 0.01. The x and y axes range from 0 to 1. A legend on the left lists the values corresponding to the colors. On the right, a panel displays "Nb of vertices : 1988" and "Nb of triangles : 3814", along with a "Show wireframe" checkbox.
- Web Browser:** A Mozilla Firefox window showing a directory listing of files including "freefem++", "INNOVATION", "HISTORY", and "manual".

with openGL graphics by L. Dumont
(to know which ubuntu you have do:)

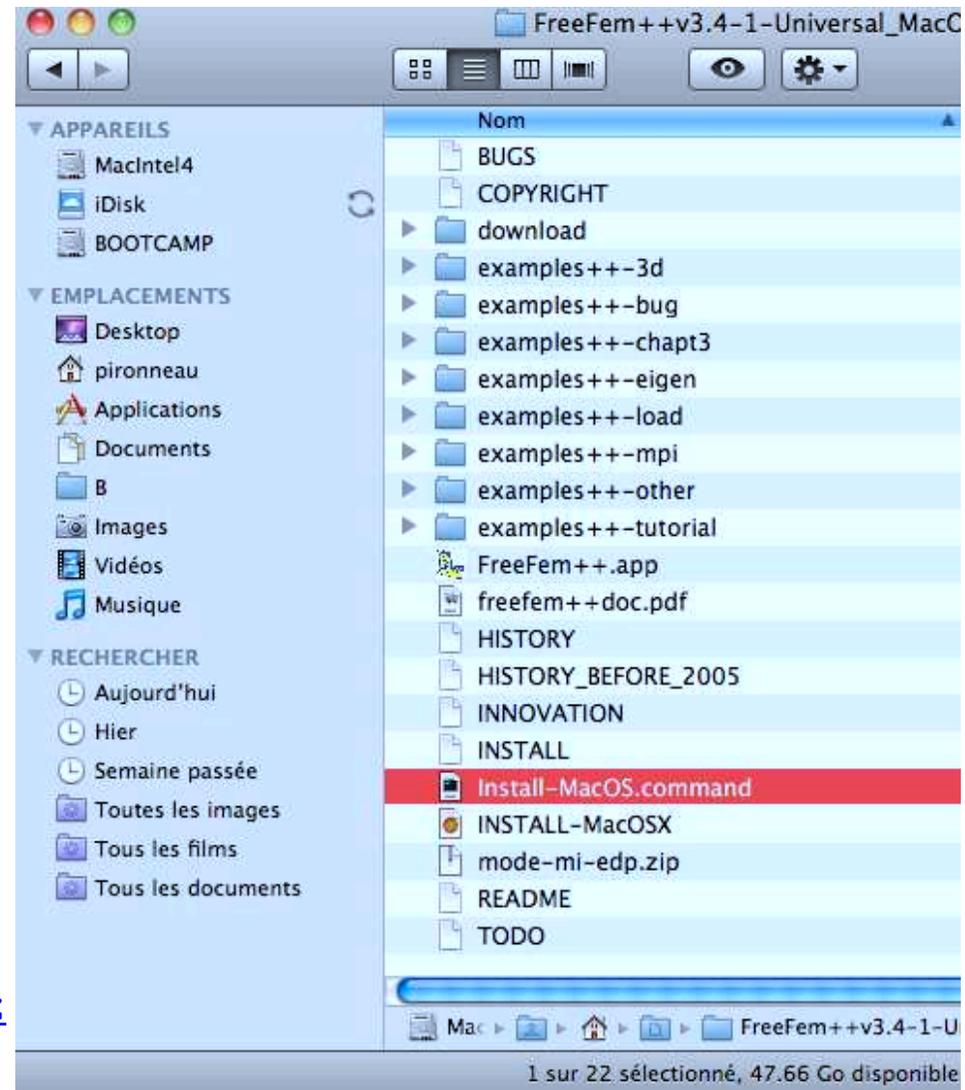

Install of freefem++

Mac OSX: Download + expand+
Download freefem++-cs

Windows:
Download the archive+exe
Download freefem++-cs

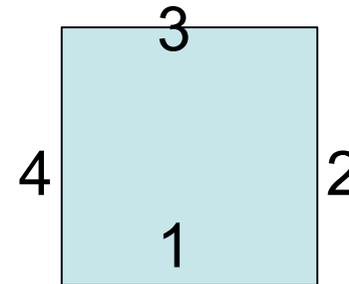

Linux: download+unzip+compile
ubuntu-32: download the
freefem++-v3.5-ubuntu.tar.gz
freefem++-v3.2-usr-lib.tar.gz

```
sudo tar zxvf freefem++-v3.5-ubuntu.tar.gz -C /  
sudo tar zxvf freefem++-v3.2-usr-lib.tar.gz -C / -k
```

2D Mesh Generation

```
mesh th = square(5,5); //unit square: bdy 1 is (0,1)x(0)
// bdy 2 is (1)x(0,1)... bdy 4 is (0)x(1,0)
mesh Th = square(5,10,[x-0.5, 10*y]); //(-0.5,0.5)x(0,10)
border a(t=0,2*pi){ x = cos(t); y = sin(t);label=2;}
border b(t=0,2*pi){ x =0.5+0.3*cos(-t); y =0.2*sin(-t);}
mesh th1 = buildmesh( a(20) + b(10));
mesh th2 = movemesh(th1,[x+1,y+2]);
mesh th3 = readmesh("mymesh.msh");
func f = sin(x+1);
```

Rule 1: The domain is on the left of its oriented boundary

Rule 2: Borders are defined piecewise analytically but must make continuous and closed curves.

Rule 3: borders may not overlap nor cross each other.

Rule 4: Each border is assigned a number but can be referred by names also. Unless overwritten the number is the order of appearance of the key word «border».

Finite Element Spaces

P0, P1, P2, P3, P1nc, P1dc, P2dc, P1b, RT0
 P03d, P13d, P23d, RT03d, Edge03d, P1b3d

```

fespace Vh(th,P1dc);  Vh v,vh;
varf  A(v,vh) = int2d(th)(v*vh/dt/2);
varf  B(vh,w) =intalldges(th)(vh*mean(w)*(N.x*u1+N.y*u2))
        -int2d(th)( w*(u1*dx(vh)+u2*dy(vh)));
    
```

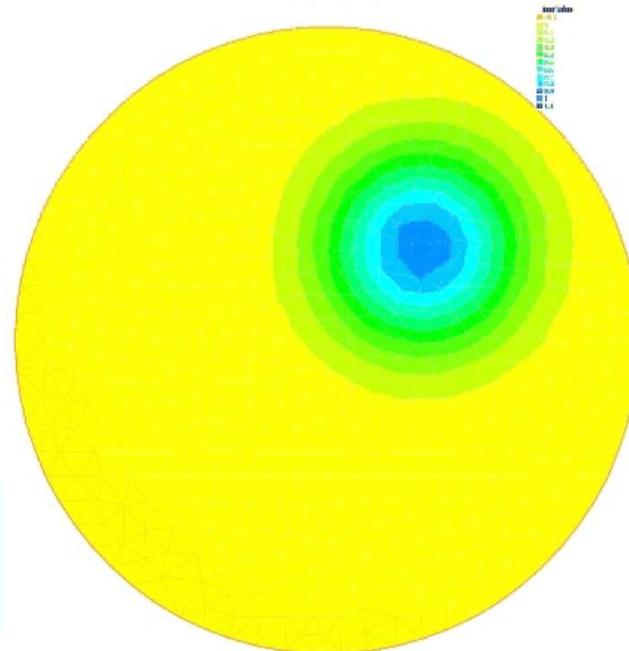

[N.x,N.y]=vecteur normal

Mean(w)=(v+ + v-)/2

$$\partial_t u + a \nabla u = 0$$

$$\frac{1}{2\delta t} \int_{\Omega} (u^{m+1} - u^{m-1}) w$$

$$= \int_{\Omega} u^m (a \nabla w) - \sum \int_{\partial T} \bar{u}^m (a \cdot n) w$$

Boundary Conditions

- Dirichlet cond by using `on(thbdylabel,u=z)`
- Neumann cond are in the variational formulation: `int1d(th,2)(nu*g*w)`

$$u - \nu \Delta u = 0, \quad \frac{\partial u}{\partial n} = g \text{ on } \Gamma_2, \quad u|_{\Gamma_1} = z$$

$$\int_{\Omega} (uw + \nu \nabla u \nabla w) = \int_{\Gamma_2} \nu gw \quad \forall w|_{\Gamma_1} = 0$$

Periodic conditions are within the space definition

```
mesh Th=square(10,15);  
fespace Vh(Th,P1,periodic=[2,y],[4,y]);
```

Conditions on RT0 elements can be tricky to formulate:

Operators

- `fespace Vh(th,P2);`
- `Vh u;`
- `dx(u), dy(u), dxx(u), dyy(u), dxy(u)`
- `convect(u,[a_1,a_2],dt), mean(u), jump(u)`

- You can make your own

- `macro div(u,v) (dx(u)+dy(v)) //`
-

- `sin(u), exp(u), ...`
- `int2d(u), u[] .max, ...`

- Rule: these are evaluated pointwise when needed . Example:
- `real I = intalledge(th)(sin(dx(u))^2);`
- is computed as the sum of the values of the integrand at the quadrature points of the edges in a loop over all triangles.

Road map for the developments

- The first goal was for teaching
- The second goal was to solve simple PDE
- Then colleagues asked for more
- It became clear that all that could be done in C could be done in freefem++
- Many asked for an interface with scilab
- Many asked for application templates
- Many asked for strong formulations
- Currently multiprocessing & GPGPU is the goal in 3D
- Load modules: Good for us but too hard for others

Quadrature formulae and Solvers

```
mesh th = square(15,15);  
fespace Vh(th,P1);  
Vh u, w, g = x+y;  
solve a(u,w,solver=UMFPACK)  
      = int2d(th)(grad(u)'*grad(w))  
        + int1d(th,qfe=qf1pE) (1.e10* u*w)  
        -int1d (th, qfe=qf1pE)(1.e10*g*w) ;
```

Because the quadrature points are the vertices, it is the same as

```
solve a(u,w) = int2d(th)(grad(u)*grad(w))  
          - int2d(f,w) + on(th,1,2,3,4,u=0);
```

solver

```
= LU, CG, Crout, Cholesky, GMRES, sparsesolver, UMFPACK
```

Syntax: an incomplete extension of C++

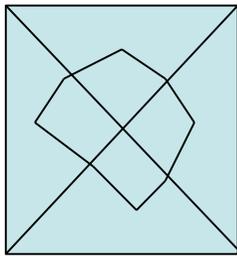

```
mesh Th = square(5,5);
fespace Vh(Th,P1); Vh u=0;
Vh<complex> uc = x+1.i*y ; //complex FE function or array

int i = 0 ;
real a=2/5 ; // quiz? value of a?
bool b=(a<2) ;
real[int] aa(10) ; // a real array of 10 value
cout<<u(.5,0.6)<<endl ; //value of FE function u at (.5,.6)
if(u<1.0) a=2; else a=1; // wrong
Vh au = (u<1.0) ? 2.0 : 1.0;
ofstream ff("myfile.txt");
for(i=0;i<Th.nv;i++) // also while, break, continue
for(int j=0;j<3;j++)
    cout<<Th[i][j].x<<"\t"<<Th[i][j].y<<"\t"<<u[][Vh(i,j)]
<<endl;

for (int i=0 ;i<u[].n ;++i) { u[][i]=1 ;
    plot(u,wait=1,dim=3,fill=1,cmm=" v"+i) ; u[][i]=0;}
```

Finite Volumes / Finite Elements

- A volume σ is associated to each vertex

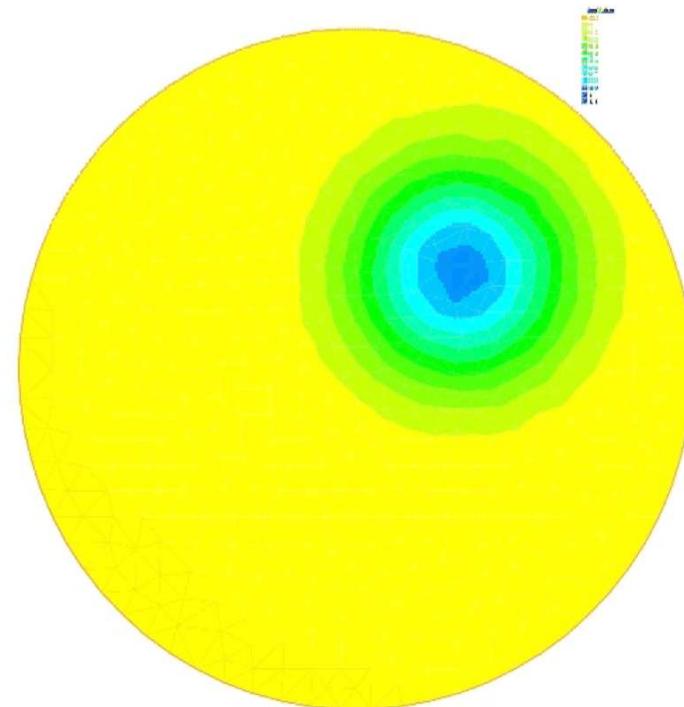

$$\partial_t v + \nabla \cdot F(v) = 0 \Rightarrow \int_{\sigma} \partial_t v + \int_{\partial\sigma} F(v) \cdot n = 0$$

triangle/triangle assembly is possible

-The first intégral is 1/3 of the same on triangles

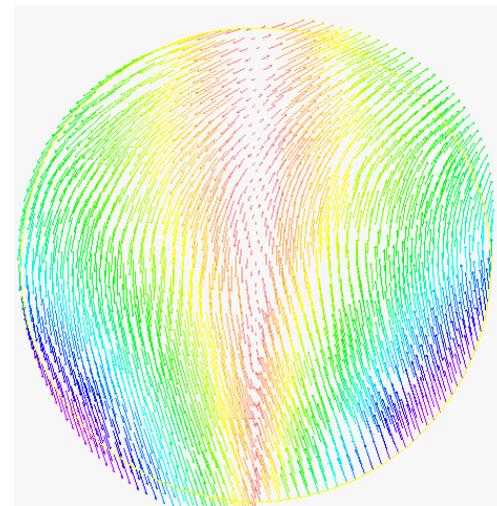

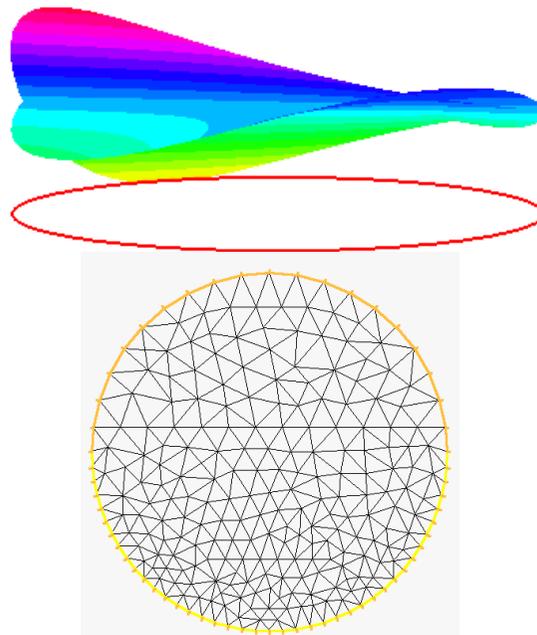

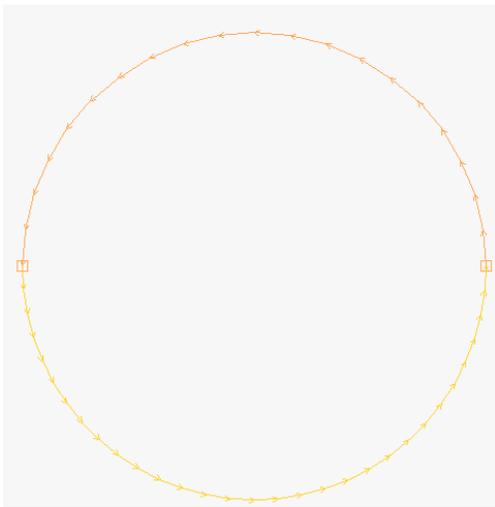

-One needs to write a load module for the boundary terms

Max=0.43 (very diffusive)

Plots

- `border a(t=0,pi){ x=cos(t); y=sin(t);}`
- `border b(t=pi,2*pi){ x=cos(t); y=sin(t);}`
- `plot(a(20)+b(40),wait=true);`
- `mesh th=buildmesh(a(20)+b(40));`
- `plot(th, wait=1,ps="th.eps");`
- `fespace Vh(th,P2); Vh u=sin(x*y), v=x*exp(-y);`
- `plot(u,v,wait=1, value=1,fill=1,dim=3);`

More: cut, link with gnuplot and medit

Interpolation

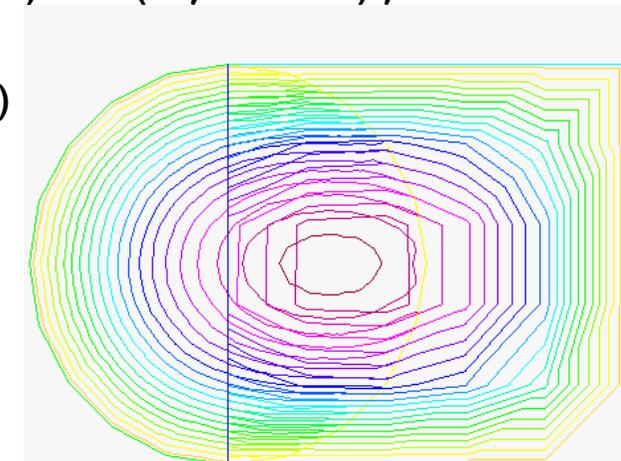

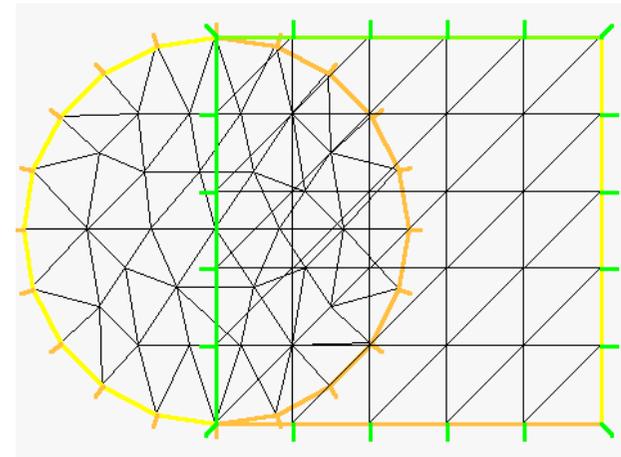

```
border a(t=-pi/2,pi/2){ x=cos(t); y=sin(t);}
border b(t=pi/2,3*pi/2){ x=cos(t); y=sin(t);}
mesh th1=buildmesh(a(10)+b(10));
mesh th2=square(5,5,[2*x,2*y-1]);
plot(th1,th2, wait=1);
fespace Vh1(th1,P2);    Vh1 w1,u1=0;
fespace Vh2(th2,P1);    Vh2 w2,u2=0;
```

```
macro Grad(u) [dx(u),dy(u)] //
func f=1;
int i; // to avoid refactorization LU
problem L1(u1,w1,solver=LU, init=i)
    = int2d(th1)(Grad(u1)'*Grad(w1))
    -int2d(th1)(f*w1) + on(b,u1=0)+on(a,u1=u2);
```

```
problem L2(u2,w2,solver=LU, init=i)
    = int2d(th2)(Grad(u2)'*Grad(w2))
    -int2d(th2)(f*w2)
+ on(4,u2=u1) +on(1,2,3,u2=0);
```

```
for(i=0;i<5;i++){
    L2; L1; plot(u1,u2,wait=1);}
```

Rule: pointwise evaluation when needed

Multi-Physics

```
mesh th=square(20,10,[x,y/4+1]);
fespace Vh(th,P2); Vh u,v,uu,vv;

mesh Th=square(20,20);
fespace Uh(Th,P1b); Uh uf,vf,uuf,vvf;
fespace Ph(Th,P1); Ph p,pp;

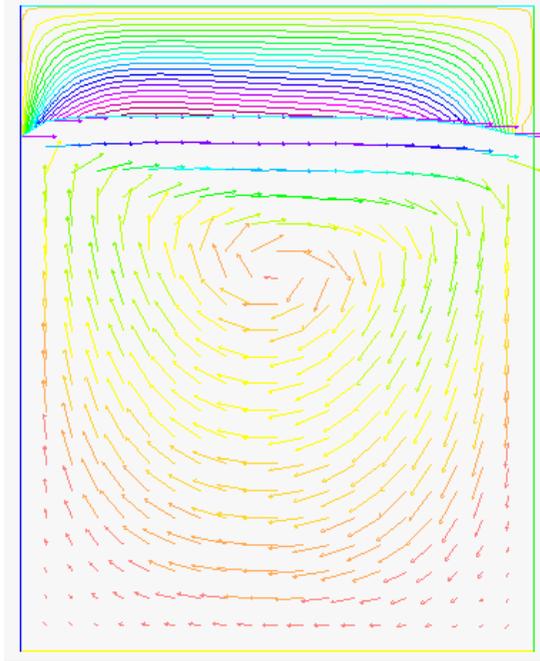

solve stokes([uf,vf,p],[uuf,vvf,pp]) =
  int2d(Th)(dx(uf)*dx(uuf)+dy(uf)*dy(uuf)
    + dx(vf)*dx(vvf)+ dy(vf)*dy(vvf)
    + dx(p)*uuf + dy(p)*vvf + pp*(dx(uf)+dy(vf)))
  + on(1,2,4,uf=0,vf=0) + on(3,uf=1,vf=0);

real s2=sqrt(2.0);
macro epsilon(u1,u2) [dx(u1),dy(u2),(dy(u1)+dx(u2))/s2] // EOM
macro div(u,v) ( dx(u)+dy(v) ) // EOM
real E=21e5, nu=0.28, mu=E/(2*(1+nu)), lambda=E*nu/((1+nu)*(1-2*nu)), f=-1;

solve lame([u,v],[uu,vv])= int2d(th)( lambda*div(u,v)*div(uu,vv)
  +2*mu*( epsilon(u,v)'*epsilon(uu,vv) ) ) - int2d(th)(f*vv)
  +int1d(th,1)(50*p*vv) + on(2,3,4,u=0,v=0);

th = movemesh(th,[x,y+400*v]);
Th = movemesh(Th, [x, y+400*y*v(x,1.0)]);

u=u; v=v; uf=uf;vf=vf;
plot(v,[uf,vf],wait=0);
```

Non-linear problem by your own algorithm

$$-\nabla \cdot ((1 + |u|^\rho) \nabla u) = f, \quad u|_{\partial\Omega} = 0$$

Try the fixed point scheme:

$$u^{m+1} \in H_0^1(\Omega) : \int_{\Omega} ((1 + |u^m|^\rho) \nabla u^{m+1} \cdot \nabla w) = \int_{\Omega} f w, \quad \forall w \in H_0^1(\Omega)$$

```
mesh th = square(10,10);
fespace Vh(th,P1);
func f= exp(x) * sin(y) ;
Vh u,w, uold=x*(x-1)*y*(y-1);

problem A(u,w,solver=LU)
    =int2d(th)((1+uold^3) *(dx(u)*dx(w)+ dy(u)*dy(w)))
- int2d(th)(f*w) + on(1,2,3,4,u=0);

for(int m=0;m<5;m++){
    A; w=u-uold;
    plot(w,wait=true,value=true);
    uold=u;
}
```

Optimization e.g.

$$-\nabla \cdot ((1 + |\nabla u|^2)^p \nabla u) = f, \quad u|_{\partial\Omega} = 0$$

```
mesh th = square(10,10);
```

```
fespace Vh(th,P1);
```

```
fespace Ph(th,P0);
```

```
func f=1;
```

```
func real F(real v){return (1+v^2)^4; } //v will be |grad(u)|
```

```
func real dF(real v){return 8*(1+v^2)^3;}
```

```
func real J(real[int] & u) {
```

```
    Vh w; w[]=u; // copy array u in the FEM function w
```

```
    return int2d(th)(F( dx(w)^2 + dy(w)^2 ) - 8*f*w) ;
```

```
}
```

```
func real[int] dJ(real[int] & u) {
```

```
    Vh w;w[]=u;
```

```
    Ph rho=dF( dx(w)^2 + dy(w)^2);
```

```
    varf au(uh,vh)=int2d(th)(rho*(dx(w)*dx(vh)+dy(w)*dy(vh))  
        -8*f*vh) + on(1,2,3,4,u=0);
```

```
u= au(0,Vh); //above with vh replaced by the ith hat function
```

```
return u;
```

```
}
```

```
real[int] u(th.nv);
```

```
for(int j=0;j<u.n;j++) u[j]=0;
```

```
BFGS(J,dJ,u,eps=1.e-6,nbiter=10,nbiterline=10);
```

```
Vh w; w[]=u; plot(w);
```

A better method is to solve, with $q=p+1$

$$\min_{u \in H_0^1(\Omega)} \int_{\Omega} (1 + |\nabla u|^2)^q - 2q \int_{\Omega} fu$$

Perspectives

- FreeFem++ is easy to use for simple problems and hard on complex problem (the no-free lunch theorem)
- Now 3D but speed is an issue: parallel version
- Sensitivity, optimisation, eigenvalues, matrix form, optimal control, mesh adaptivity, etc?
